ASSOCIATION RULE MINING

BEIYU LIN

RULE GENERATION

- Given a frequent itemset L, find all non-empty subsets f ⊂ L such that f → L – f satisfies the minimum confidence requirement
  - If {A,B,C,D} is a frequent itemset, candidate rules:

ABC →D, ABD →C, ACD →B, BCD →A,
A →BCD, B →ACD, C →ABD, D →ABC
AB →CD, AC → BD, AD → BC, BC →AD,
BD →AC, CD →AB,

$k = 4$

$2^k - 2$

$(\emptyset \to L ; L \to \emptyset)$

TID	Items
1	Bread, Milk
2	Beer, Bread, Diaper, Eggs
3	Beer, Coke, Diaper, Milk
4	Beer, Bread, Diaper, Milk
5	Bread, Coke, Diaper, Milk

- If |L| = k, then there are $2^k - 2$ candidate association rules (ignoring L → ∅ and ∅ → L)

$minsup = 0.4 \Leftrightarrow min\_sup\_count = 2$

$X \to Y \quad c = \#X \cup Y / \#X$

$s = \frac{\delta}{\#T}$

$f: \delta \geq \delta_{min}$
$s \geq s_{min}$

RULE GENERATION

- In general, confidence does not have an anti-monotone property

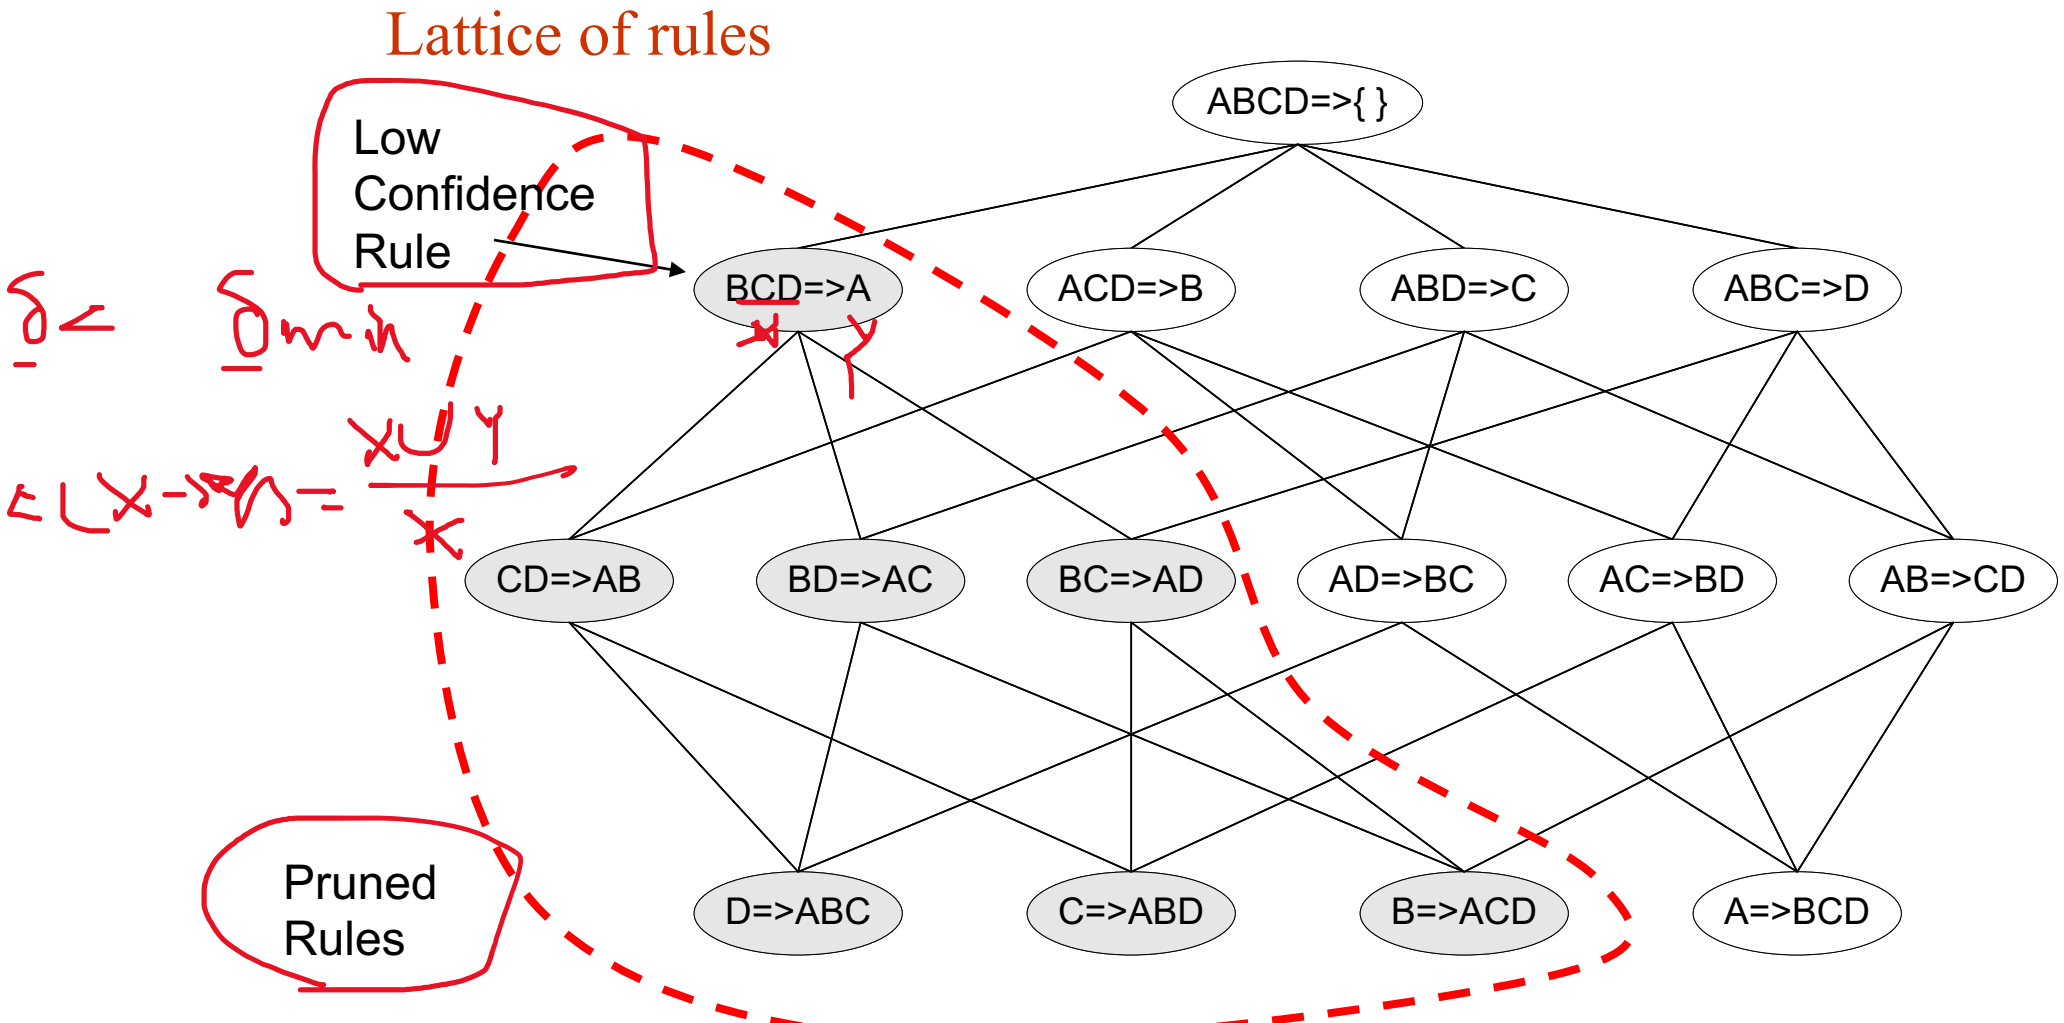
  c(ABC $\rightarrow$D) can be larger or smaller than c(AB $\rightarrow$D)

- But confidence of rules generated from the same itemset has an anti-monotone property
  - E.g., Suppose {A,B,C,D} is a frequent 4-itemset:

$$c(ABC \rightarrow D) \geq c(AB \rightarrow CD) \geq c(A \rightarrow BCD)$$

  - Confidence is anti-monotone w.r.t. number of items on the RHS of the rule

RULE GENERATION FOR APRIORI ALGORITHM



ASSOCIATION ANALYSIS: BASIC CONCEPTS

Algorithms and Complexity

FACTORS AFFECTING COMPLEXITY OF APRIORI

- Choice of minimum support threshold
- Dimensionality (number of items) of the data set
- Size of database
- Average transaction width

FACTORS AFFECTING COMPLEXITY OF APRIORI

- Choice of minimum support threshold
  - lowering support threshold results in more frequent itemsets
  - this may increase number of candidates and max length of frequent itemsets
- Dimensionality (number of items) of the data set
- Size of database
- Average transaction width

TID	Items
1	Bread, Milk
2	Beer, Bread, Diaper, Eggs
3	Beer, Coke, Diaper, Milk
4	Beer, Bread, Diaper, Milk
5	Bread, Coke, Diaper, Milk

IMPACT OF SUPPORT BASED PRUNING

TID	Items
1	Bread, Milk
2	Beer, Bread, Diaper, Eggs
3	Beer, Coke, Diaper, Milk
4	Beer, Bread, Diaper, Milk
5	Bread, Coke, Diaper, Milk

Items (1-itemsets)

Item	Count
Bread	4
Coke	2
Milk	4
Beer	3
Diaper	4
Eggs	1

Minimum Support = 3

If every subset is considered,
$^6C_1 + {}^6C_2 + {}^6C_3$
6 + 15 + 20 = 41
With support-based pruning,
6 + 6 + 4 = 16

Minimum Support = 2

If every subset is considered,
$^6C_1 + {}^6C_2 + {}^6C_3 + {}^6C_4$
6 + 15 + 20 +15 = 56

FACTORS AFFECTING COMPLEXITY OF APRIORI

- Choice of minimum support threshold
  - lowering support threshold results in more frequent itemsets
  - this may increase number of candidates and max length of frequent itemsets
- Dimensionality (number of items) of the data set
  - More space is needed to store support count of itemsets
  - if number of frequent itemsets also increases, both computation and I/O (input / output) costs may also increase
- Size of database
- Average transaction width

→ stream Data

How to do sampling for stream data
While we do not know how many data a

Support threshold (by count) : 5
Frequent itemsets: {F}
Maximal itemsets: {F}

Support threshold (by count): 4
Frequent itemsets: {E}, {F}, {E,F}, {J}
Maximal itemsets: {E,F}, {J}

Support threshold (by count): 3
Frequent itemsets:
All subsets of {C,D,E,F} + {J}
Maximal itemsets:
{C,D,E,F}, {J}

{C},{D}, {E},{F},{CD},{CE},….., {J}

CLOSED ITEMSET

- An itemset X is closed if none of its immediate supersets has the same support as the itemset X.
- X is not closed if at least one of its immediate supersets has support count as X.
